to cutting fruit, though seen in Africa, was probably introduced there by the early traders, and all machetes found today in Haiti are imported from Europe or America. The same is true of the hoe, for the short-handled, broad-bladed West African hoe has given way to the European long-handled type, though the blade of the Haitian hoe is somewhat broader than that used in America and Europe. Despite the presence of domesticated animals to draw the plow, this implement has never gained favor in Haiti, nor have recent efforts to teach the Haitian peasant the use of the plow achieved any degree of success. He prefers his African mode of cultivation, to say which implies more than just the employment of a certain implement, since even such matters as the manner in which he employs his hands and feet in the process of planting are included. When the Dahomean plants, for example, he holds a calabash of seed under his left arm, from which he takes the grains with his right hand. As he moves down the rows of newly turned earth, he makes a depression with the heel of his right foot, drops a few grains into this depression and, replacing the earth with his toes, takes a step so that he can repeat the process with his left foot. This is exactly the manner in which Haitians were observed planting in the valley of Mirebalais.[8] Unlike the usage in Africa, however—where the men clear the ground, the men and women plant, and the women tend the growing crops—the European pattern, which places agriculture in all its essential phases in the hands of men, has been taken over almost in its entirety.

The women have retained almost without change the African modes of preparing food. Grain is first pounded in an African-like mortar, with an aboriginal type of pestle, while the shelled kernels are winnowed in a large round basketry tray. The cooking is either done on a raised mud platform in the cooking shelter, as in West Africa, or on three stones, employed as rests for the pots, a method equally characteristic of Africa. In the Haitian cuisine the prevalence of stews, of

work until noon. A two-hour siesta followed, but from two until sunset there was steady work. Only after evening prayers was the worker free. During the day no cultivator might leave his task except for direst need. The lame and the halt were not required to till the fields, but must carry around buckets of drinking water, take care of the children, and do odd jobs about the estate.

Christophe made a steady and, in the main, successful effort to explain to the people the necessity of hard work on the plantation. As with the noblemen, the serfs knew precisely what was expected of them, and why. Their regimentation was strict, but understandable. It was clearly stipulated that if a worker shirked his job he was to be put in prison and made to do forced labor there. Laziness in the fields was to be punished by strokes from the overseer's liane. Hard and steady work was demanded during the whole thirteen years of Christophe's rule, but only rarely was there complaint, as there had been constantly under Dessalines, of cruelty on the part of overseers.

The quarter part of the total crop of any plantation was to go to the workers as wages, and, since production increased and prices rose, this quarter which they were free to spend as they pleased provided a powerful incentive to further industry. As compared with anything they had known before, the workers were now recipients of an ample income. On the plantations they cultivated the money crops of sugar and coffee. In addition, each family had its own garden plot on which to raise the food crops—yams, plantains, beans, and bananas—for personal use.[2]

Christophe was so far ahead of his time that he tried to introduce British methods of agriculture into his kingdom. The results were insignificant. The plough, although obviously superior in efficiency to the hoe, eliminated the sociable companionship of working in unison, and demanded horses and mules which the country lacked. The innovations were consequently too radical to be accepted. In the main, the agricultural methods of the kingdom continued to be those familiar in slave days.

Thirteen years of careful direction can fix many patterns of social routine. One of Christophe's rules was that no cultivator attached to

[2] The staples of other countries, such as Irish potatoes, wheat, barley, and oats, did not flourish in Haiti. On the large plantations, indigo and cotton, which had been money crops in the French régime, were generally neglected, as they had been in the time of Dessalines.
